

Project Design Phase Proposed Solution Template

Date	08 September 2026
Team ID	_____
Project Name	Incident Lifecycle Automation in ServiceNow
Maximum Marks	2 Marks

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Service Desk and Level 2 teams need a consistent way to create, classify, investigate, escalate, resolve and document incidents. Inconsistent classification, incomplete information, manual escalation, disconnected related records and incomplete resolution documentation can delay resolution and reduce traceability.
2	Idea / Solution description	Implement a structured Incident Management lifecycle in ServiceNow. The solution connects Service and Service Offering setup, incident creation and classification, Knowledge Management / Agent Assist, reassignment and Level 2 investigation, Emergency Change Requests, Child Incidents, resolution and closure, Knowledge Article creation, SLA visibility, final validation and testing.
3	Novelty / Uniqueness	The solution connects multiple Incident Management activities into one traceable lifecycle rather than treating incident, knowledge, change, child-incident and resolution activities as isolated tasks. It emphasizes connected records and validation across the complete workflow.
4	Social Impact / Customer Satisfaction	Faster and more consistent incident handling improves the support experience for users. Better classification and routing reduce unnecessary delays, while knowledge-assisted troubleshooting and clear resolution documentation improve service quality and confidence.
5	Business Model (Revenue Model)	This is an internal enterprise IT service-management solution. It is not designed as a standalone revenue-generating product. Business value is realized through improved operational efficiency, reduced handling effort, faster resolution and better reuse of organizational knowledge.
6	Scalability of the Solution	The ServiceNow platform can support growth in incidents, users, services, configuration items, knowledge articles and related records. The standardized lifecycle can be extended to additional support groups and services without changing the core process.

Project Design Phase

Problem – Solution Fit Template

Date	08 September 2026
Team ID	_____
Project Name	Incident Lifecycle Automation in ServiceNow
Maximum Marks	2 Marks

The Problem–Solution Fit below adapts the uploaded canvas template to the Incident Lifecycle Automation project. It connects customer problems, behaviours, triggers, emotions, existing alternatives and the proposed ServiceNow solution.

1. CUSTOMER SEGMENTS Service Desk Agents; Level 2 Technicians; Service Owners / Support Stakeholders; Change Stakeholders; Project Team.	2. JOBS-TO-BE-DONE / PROBLEMS Create complete incidents; classify correctly; find troubleshooting knowledge; route/escalate incidents; investigate with full context; connect changes and child incidents; document resolution.	3. TRIGGERS A new user issue is reported; classification is required; existing knowledge may help; Service Desk cannot resolve; an urgent change is needed; related/recurring issues appear; incident is ready for closure.
4. EMOTIONS: BEFORE / AFTER Before: concern about incomplete information, incorrect routing, delays and missing context. After: greater confidence, clarity, traceability and satisfaction with the incident process.	5. AVAILABLE SOLUTIONS Manual incident handling; basic Incident Management forms; separate knowledge search; manual reassignment; separate change/child-incident tracking; informal resolution notes.	6. CUSTOMER CONSTRAINTS Need to use the existing ServiceNow environment; users have different roles and permissions; incident and related records must remain traceable; support activities may involve multiple teams.
7. PAINS / ROOT CAUSES Inconsistent classification; incomplete information; difficulty finding knowledge; manual escalation; lack of Level 2 context; disconnected incident/change relationships; difficulty tracking recurring incidents; incomplete resolution documentation.	8. BEHAVIOUR Agents enter incident details, classify issues, search knowledge, assign/escalate and update records. Level 2 reviews history and work notes, investigates, creates changes/child incidents when needed and documents resolution.	9. GAINS / EXPECTED BEHAVIOUR Standardized classification and routing; faster investigation; connected related records; clearer Level 2 handoff; documented resolution; reusable knowledge; better SLA visibility and validation.
10. OUR SOLUTION A connected ServiceNow Incident Lifecycle Automation workflow covering service setup, incident creation, classification, knowledge/Agent Assist, escalation, Level 2, emergency change, child incidents, resolution, knowledge creation, SLA and validation.	11. VALUE / FIT The solution directly addresses the main pain points by standardizing the workflow and preserving context across incident, service, knowledge, change, child-incident and SLA records.	12. CHANNELS / TOUCHPOINTS ServiceNow Incident Management interface, incident forms/workspace, Service/Service Offering records, Knowledge / Agent Assist, assignment and Level 2 queues, Change Requests, Child Incidents, SLA and related-record views.

Fit conclusion: The proposed ServiceNow workflow is a strong fit because it addresses the identified operational pain points at the same stages where they occur, while keeping related records connected and supporting a consistent end-to-end lifecycle.

Project Design Phase

Solution Architecture

Date	08 September 2026
Team ID	_____
Project Name	Incident Lifecycle Automation in ServiceNow
Maximum Marks	4 Marks

Solution Architecture:

The architecture bridges the Incident Management business workflow and the ServiceNow platform capabilities. The Service Desk Agent starts the incident, Incident Management controls the lifecycle, and supporting capabilities provide service/CI context, knowledge assistance, Level 2 investigation, emergency change, child-incident relationships, SLA visibility, resolution documentation and reusable knowledge. Final validation and testing confirm that the connected workflow operates as intended.

Figure 1: Solution architecture and data flow of the Incident Lifecycle Automation in ServiceNow.

Key architectural flow:

- Service Desk Agent → ServiceNow UI / Incident Workspace → Incident Management Lifecycle.
- Incident Management uses Service / Service Offering and CI information for classification and context.

- Knowledge Management / Agent Assist supports troubleshooting and resolution.
- Unresolved incidents can be assigned or escalated to Level 2 Support.
- Level 2 may create/link an Emergency Change and create Child Incidents when required.
- Incident, SLA and related records remain connected for traceability.
- Resolution and closure information can lead to Knowledge Article creation.
- Final validation, testing and deployment validation confirm the complete lifecycle.
